The installation of the model is broken up into four major steps:

- Install TransCAD
- Download the model
- Add-in setup

Install TransCAD

The model requires **TransCAD Version 8 Build 22180**, which must be purchased and downloaded from Caliper. Assuming you already own a valid license for the software, you can email tcsupport@caliper.com to request the specific version and build. Caliper will prepare the files and send you a download link.

Once you have the install files, install TransCAD to the following directory:

```
C:\Program Files\TransCAD_8_22180
```

For example, the `bmp` directory would be located here:

```
C:\Program Files\TransCAD_8_22180\bmp
```

Download the model

Get the most recent [release](#) of the model. This requires a GitHub account that has access to the repository (otherwise you'll see a 404 error message).

For the latest release listed, download the `client_release_v###.zip` file. The model files can be downloaded and unzipped to any directory (**must use winzip**). The developer of the model used the following:

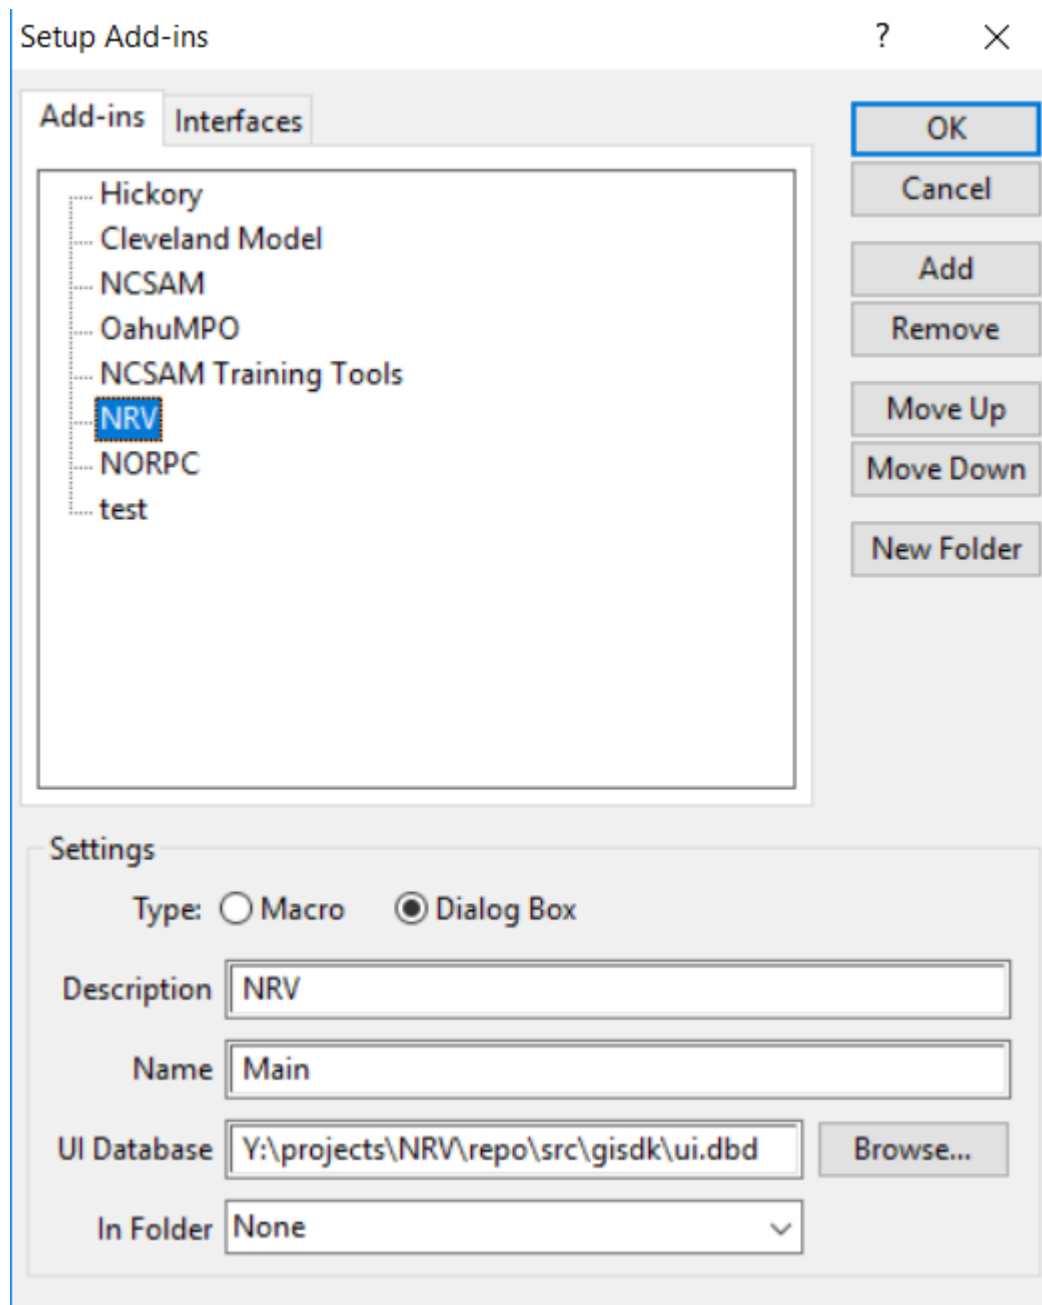

```
C:\projects\NRV\repo
```

Important Note: Avoid spaces in this directory path. Spaces may lead to crashes during model runs. Also, if you unzip with file explorer instead of winzip, you will have to recompile

model runs. Also, if you unzip with file explorer instead of winzip, you will have to recompile the model and GT UIs.

Add-In setup

The final step is to setup the "add-ins" options within TransCAD. From the "Tools" drop down menu, select "Setup Add-ins". Click the "Add" button to create a new add-in, and fill it out as shown below. (Ignore the other models listed in the screen shot.)

Now the model can be opened via "Tools" -> "Add-ins" -> "NRV"
